Air pass through the air vents construction at the frame and wind resistance is reduced

Air stimulation graphic for normal racket shows higher resistance

The patent Bio-inner-cone technology shifts the bending point of the shaft upwards to improve precision in smashing and agility

The application of special air vents construction reduces wind resistance by 8.2% and enhances shuttle speed by 3.1%. It also minimises the formation of eddy after swinging the racket, prevents racket instability and improves precision of the shuttle dropping point
